

Warmth index for duvets by Christian Fischbacher

Each individual has his own personal warmth requirements. The warmth index considers and grades on two specific parameters, which determine the properties of a duvet: The warmth retention capacity and the moisture absorption of the duvet.

Both parameters together allow the duvets to be classified into four categories. Christian Fischbacher has listed the details of the warmth index for every duvet.

The guidelines serve as an aid in selecting the duvet that best suits your needs.

Warmth index 1

For sleepers with very low warmth requirements and/or sleepers in bedrooms with high levels of heating. Suitable for waterbeds.

Warmth index 4

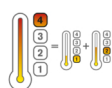

For sleepers with high warmth requirements and/or for sleepers in cool bedrooms.

Warmth index 2

For sleepers with low warmth requirements and/or for sleepers in heated bedrooms. Suitable for waterbeds.

Warmth index Double duvet

Double duvet, light single duvet for the summer, heavy single duvet for spring/autumn and, buttoned together, suitable for the winter.

Warmth index 3

For sleepers with average warmth requirements and/or for sleepers in normally-heated bedrooms with low levels of heating.
